Rotary Borehole Project Kenya

powered by Solar energy

- The project will be located at Kithima/Maili Saba, in Meru County, Kenya,
- We need help to fund the drilling, water testing for quality, plus materials and labour to build the infrastructure.
- A borehole will provide a sustainable source of water to ensure the 250 needy school children and the farm animals have food, better hygiene and a cleaner environment.
- Working partners in this project are the Rotary Clubs of Bayswater and host country RC Meru D9212 Kenya.

Kithima is an arid area of Meru County on the slopes of Mount Kenya.

Water is important to support life, health and food security.

This example, was managed by the Rotary Club of Meru, Kenya and is the chosen model to provide adequate water to support a village into the future.

Healthy response for crops, water to support grazing and watering for livestock all form part of a long list of benefits making whole villages capable of realising life-dreams once thought unreachable.

Water truly changes these previously arid areas into productive support regions and a background for young families to join the ranks of self-support.

In turn, young children have demonstrated marked improvement in educational achievement with the benefit of regular diet.
